

Performance of the PIUs of the IF system of GMRT and a study of their Repeatability and Interchangeability

Venkat, Som

NCRA LIBRARY

R00106

1.0 Introduction:

This report presents the measurement plots of a set of PIUs of a type to form the IF system of GMRT and analyses the repeatability of performance between PIUs of the same type and hence their interchangeable use between antennas.

2.0 Block Diagram:

The block diagram of the IF system is given in Fig. 1 on Page 4. Following may be noted:

(a) The PIU to convert the RF signal input to a First IF frequency of 70 MHz and processing at that frequency is numbered as C41/mmm and C41/nnn where mmm and nnn are 3 digit serial numbers starting from 101. Each ABR will have Two such identical PIUs.

(b) The PIU to convert the First IF output from C41 to the Second IF at 130 MHz and processing at that frequency is numbered as C42/xxx where xxx is a 3 digit Serial Number starting from 101. Each ABR will have One such PIU.

(c) The PIU to convert the First IF output from C41 to the Second IF at 175 MHz and processing at that frequency is numbered as C43/yyy where yyy is a 3 digit Serial Number starting from 101. Each ABR will have One such PIU.

(d) The outputs of C42 and C43 are combined (along with LO reference return signals) and then passed through a low pass filter at 205 MHz. The combiner and the filter are located in a 19" panel at the rear of the rack, called "Interface Panel".

3.0 Measurement Plots:

Plots 1 to 7 (Pages 6 to 12) give the MEASURED response of C41 PIU, with a set-up as in Fig. 2a (page 5).

Plots 8 to 10 (pages 13 to 15) give the MEASURED response of C42 PIU, together with units in the interface panel, with a set-up as in Fig. 2b (page 5).

Plots 11 to 14 (pages 16 to 19) give the MEASURED response of C43 PIU, together with units in the interface panel, with a set-up as in Fig. 2b (page 5).

Plot 15 (page 20) gives the MEASURED 2-tone intermodulation response of a typical C41 PIU. The set-up used is also included.

Plot 16 (page 21) gives the MEASURED 2-tone intermodulation response of a typical C42 PIU in ALC OFF mode. The set-up used is also included.

Plot 17 (page 22) gives the MEASURED 2-tone intermodulation response of a typical C42 PIU in ALC ON mode. The set-up used is also included.

The IMD response of C43 PIU is similar to plots 16 and 17.

4.0 Description of a typical plot for C41 (Plots 1 to 7):

All measurements are taken with a pre-attenuation of 16 dB. Each plot has Four panels. Plots are as a function of Nine RF Mid-band frequency, whose value is 50, 150, 235, 325, 610, 1060, 1170, 1280 and 1390 MHz (called as bands A, B ... H and I). Top-Left panel excludes RF band of 50 MHz. As a rule, gain decreases as RF mid-band frequency increases.

5.0 Description of typical plot for C42 and C43 (Plots 9 to 14):

All measurements are taken with a pre-attenuation of 16 dB. Plot at Top-Left panel is self-explanatory. Other Three plots are as a function of whether ALC is ON or OFF. The Detector output and ALC feedback voltages (FBV) can be logged through MCM # 9 at each antenna and analysed.

6.0 Description of IMD response plots (Plots 15 to 17):

Measurements are taken with bandwidth of 16 MHz and pre-attenuation of 16 dB for C41 PIU and given as Plot 15. For C42 PIU (Plots 16 and 17), the post-attenuation setting is 16 dB. The plots are self-explanatory.

7.0 Further work:

(a) Curve-Fitting to find the coefficients of a polynomial to represent each curve.

Problem has been defined to Rakesh.

(b) Measurement of the group-delay response of the PIUs.

Reports giving data on group delay response of individual chassis, specifically the non-linear device like the ALC is already available. Measurement of the response of an integrated PIU is being postponed and will be the subject of a future report.

8.0 Analysis of the plots:

Analysis of response plots 1 to 7 of PIU C41 indicate that the peak-to-peak gain variation between the PIUs is of the order of ± 3 dB. The cause has been identified and it should be possible to reduce the variation to ± 1 dB in future units. However, this is not necessary because of the plans to mathematically represent the plots by the curve-fitting exercise, the result of which can be made available as a look-up table for each PIU.

The tentative format of the look-up table is enclosed as Table 1 (pages 23 and 24). Please e-mail your suggestions to me for considering any additions/ modifications/ improvements to the table. (Note I have deliberately left some room for your suggestions!) Note that intelligent use of this table will have to be made by the On-line program to get the best performance out of the system.

Analysis of response plots 8 to 10 of C42 and 11 to 14 of C43 indicate that the ALC operating point is same for all the PIUs to within ± 1 dB. The format for the look-up table for these PIUs is enclosed as Table 2 (pages 25 and 26).

Analysis of response plots 15 and 16 indicate that in the ALC OFF mode, if the overall system is operated to the limits of the linear mode as defined by the 1 dB compression point, the worst case IMD performance is around -40 dBc.

Analysis of response plots 15 and 17 indicates that in the ALC ON mode, the operation of the system with an input level corresponding to the limits as set by ALC OFF mode will result in an IMD performance around -55 dBc.

9.0 Important note for Field Servicing:

If the concept of intelligent use of the look-up table through the on-line program for getting the best out of the system is accepted, note that field servicing must be limited to changing a faulty PIU to a tested and released unit and updating the look-up table entries by the Service personnel.

10.0 Commissioning notes:

The following table gives the serial number of PIUs which will be installed and commissioned at C1 and C0 in the next few weeks:

	RF Channel 1		RF Channel 2	
Antenna C1 :	C41/107	C42/114	C41/110	C43/115
Antenna C0 :	C41/101	C42/113	C41/104	C43/111

UNITS ARE AVAILABLE AT H-LAB, KHODAD OR RX-LAB, PUNE FOR INSTALLATION AND COMMISSIONING AT C14, C11 AND W1 AT THE APPROPRIATE TIME. UNITS ALREADY INSTALLED AT C9 WILL BE BROUGHT BACK TO PUNE AT AN APPROPRIATE TIME FOR SIMILAR CHARACTERISATION.

Users may note the deliberate mixing of running numbers of PIUs has been done to bring home the point that a PIU is NOT unique to any antenna.

12.0 Acknowledgement:

The efforts of Rakesh in writing the software for standardising the presentation format of plots 1 to 14 and realising them with minimum keystrokes entry in the Unix environment is highly appreciated. Thank you, Rakesh!

TABLE 1. PRELIMINARY FORMAT FOR LOOK-UP TABLE FOR C41 PIU

The look-up will be in two stages: Stage A to generate an ASCII file for mapping the PIU serial number to an antenna and stage B, giving details for the individual PIU.

Stage A. Tentative format:

```

*****
Antenna          RF Channel 1      RF channel 2
C0                101                104
C1                107                110
C2
||
C14
W1
||
W6
E1
||
E6
S1
||
S6
*****

```

Stage B: Tentative format for PIU C41/nnn:

Data on stop-band characteristics, computed using the raw data which resulted in the top-right and bottom-left panels of plots 1 to 7:

```

*****
Nominal IF bandwidth in MHz      Actual Bandwidth in MHz
6                                1 dB    3 dB    10 dB    15 dB
16
*****

```

Data on the coefficients of a polynomial $y = a + b*x + c*x**2 + d*x**3 + \dots$ to represent the ripple, slope in the band and other pass-band characteristics, computed using the raw data which resulted in the top-left, top-right and bottom-left panels of plots 1 to 7. Coefficients for the other Eight RF Mid-bands namely 50, 150, 235, 610, 1060, 1170, 1280 and 1390 MHz are similarly computed.

RF mid-band in MHz	IF bandwidth in MHz	Band limit for computing	Coefficients computed			
			a	b	c	d
325	6	± 2				
325	6	± 4				
325	6	± 6				
325	16	± 4				
325	16	± 8				
325	16	± 16				
325	32	± 8				
325	32	± 16				
325	32	± 32				

Data on the coefficients of a polynomial $y = a + b*x + c*x**2 + d*x**3 + \dots$ to represent the power response and hence estimate linearity limits, computed using the raw data which resulted in the bottom-right panel of plots 1 to 7.

RF mid-band in MHz	Coefficients computed			
	a	b	c	d
50				
150				
235				
325				
610				
1060				
1170				
1280				
1390				

TABLE 2. PRELIMINARY FORMAT FOR LOOK-UP TABLE FOR C42 & C43 FIUS

The look-up will be in two stages: Stage A to generate an ASCII file for mapping the PIU serial number to an antenna and stage B, giving details for the individual PIU.

Stage A. Tentative format:

```

*****
Antenna          C42/nnn          C43/nnn
  C0                113                111
